

When the plan breaks, what happens next?

A safety and recovery workbench
for bimanual manipulation.

THE PROBLEM

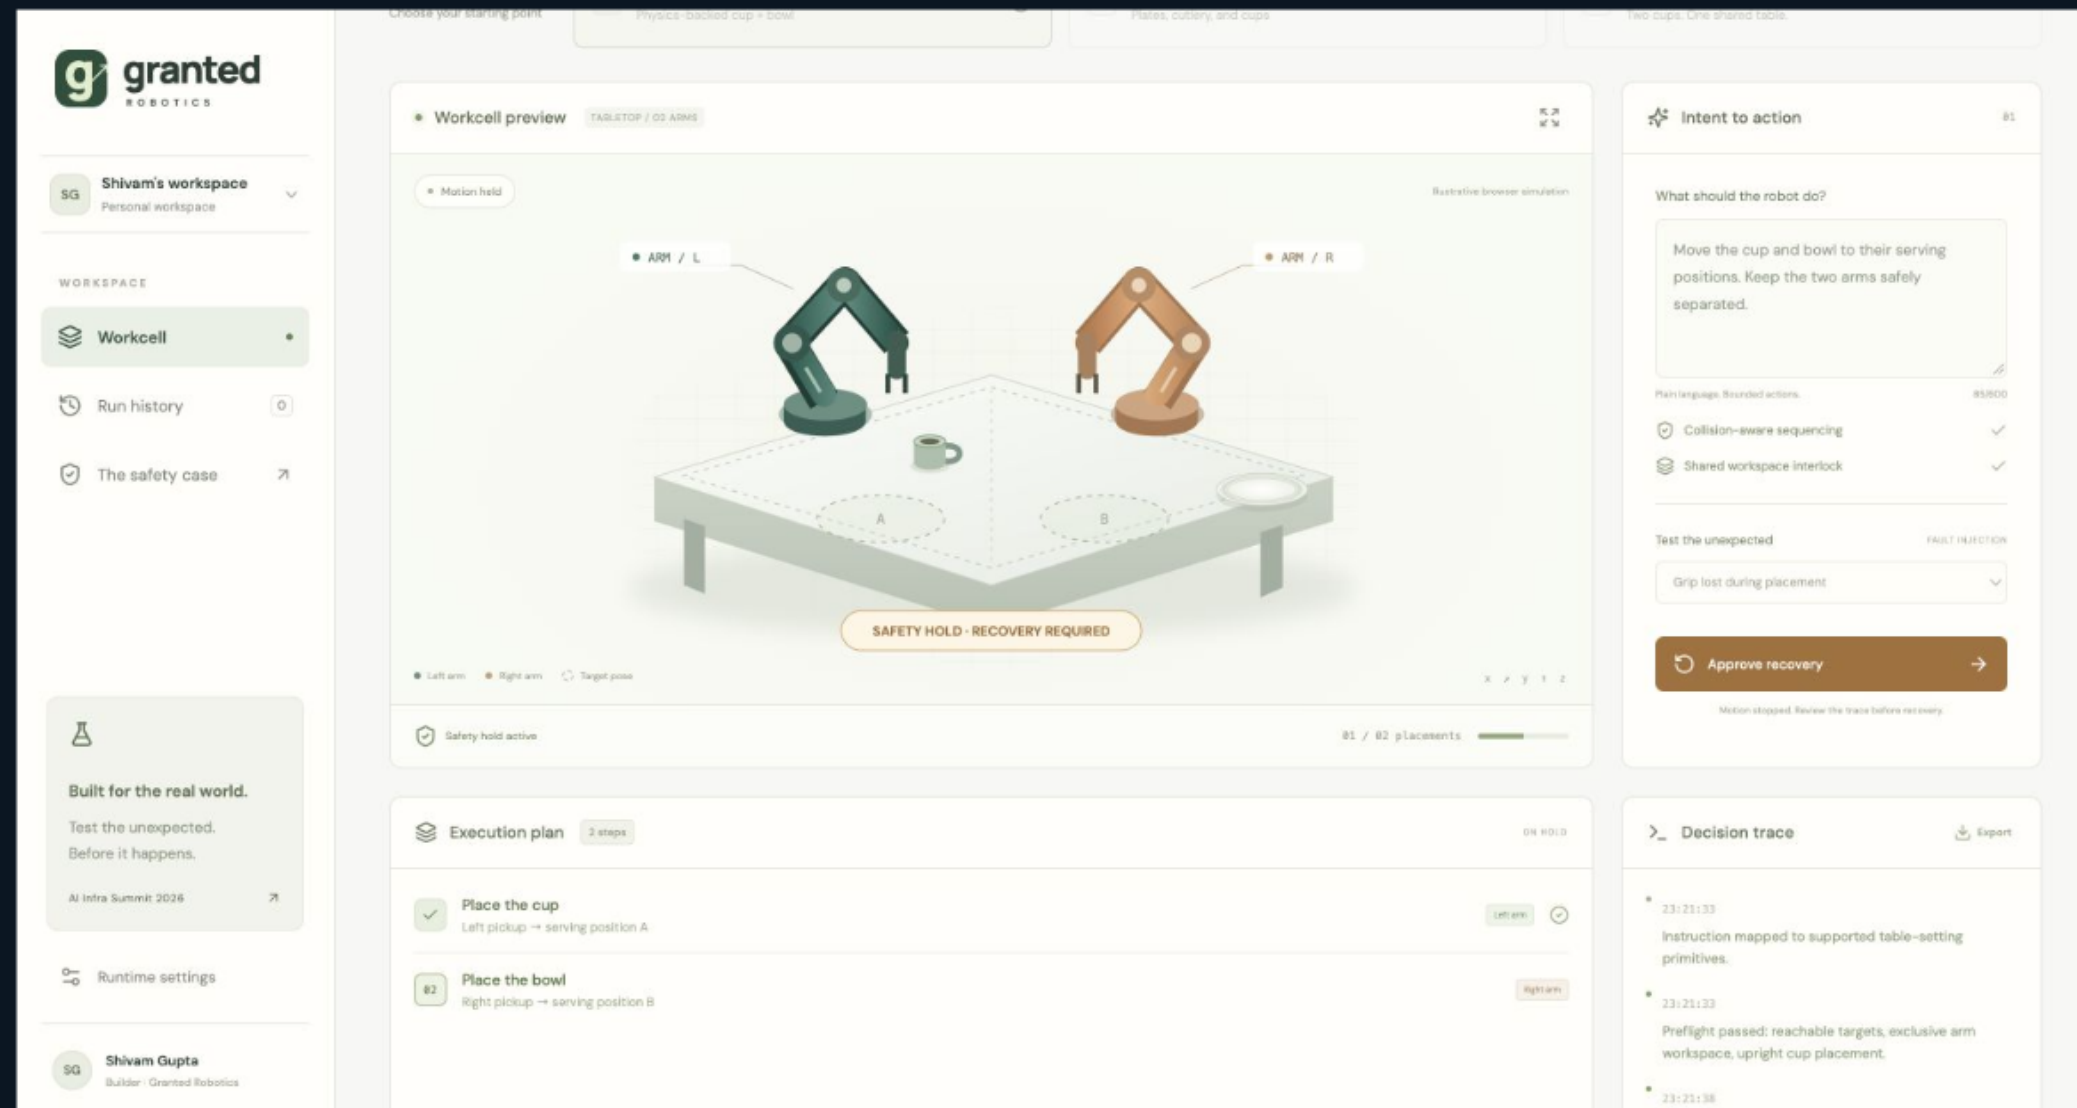

The failure is where the work begins

A displaced object. A slipped grasp.
An obstacle in the workspace.

Engineers need a repeatable way to
inspect the response.

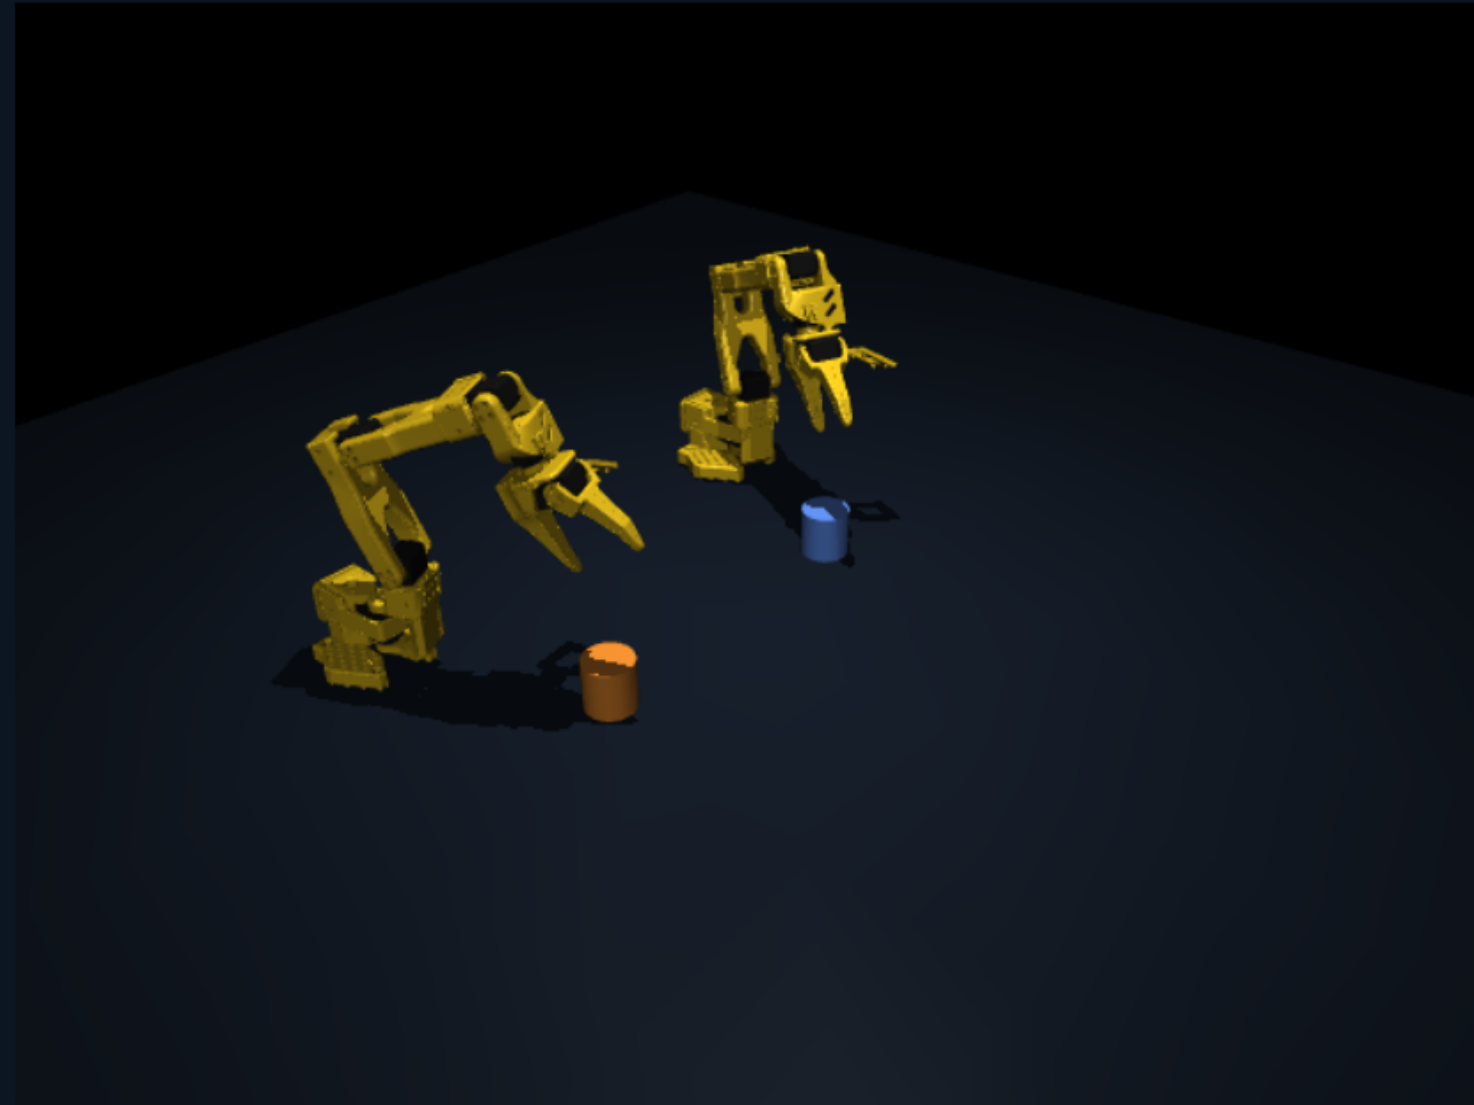

THE WORKBENCH

The recovery workbench

THE IMPLEMENTATION

MuJoCo execution with two SO101 arms

Recovery changed the outcome

Grip loss, across 10 randomized seeds
With recovery: 10 / 10 completed
Without recovery: 0 / 10 completed

50 simulation runs. Local Apple CPU.
No Intel Core Ultra hardware claim.

Less time reproducing the same failure

First customer: robotics integrators

First pilot: one task and its recurring faults

Success measure: time to diagnose a regression

GRANTED ROBOTICS

Before the next action, show the evidence

granted-robotics.web.app

Explore the workbench.
Reproduce the simulation.
